Of 1413 diabetics who received constant outpatient therapy, 42.8% were successfully controlled with D 860. The initiation of an oral antidiabetic drug is possible in the outpatient status in spite of frequently expressed opinion to the contrary if the necessary experience and possibility of checking the metabolism as well as consideration of the control criteria are present. Treatment with tolbutamide proved itself to be advantageous in a total of 630 patients over a two-year period of oral therapy. Generally speaking, only older patients with a moderate insulin requirement are well-suited for oral therapy. This therapy represents a substantial advantage for these patients. With the initiation of D 860 therapy in diabetics, side effects including undesirable side effects on the albumin metabolism and the plasma amino nitrogen were rarely observed or not observed at all. Most infantile enteritis is of infectious nature. The most common causal microorganisms are to be considered the enteropathogenic coli types (dyspepsia coli bacteria), whose distribution over the entire earth is ubiquitous. In Germany about 30 to 40% of all infantile enteritis is caused by dyspepsia coli

The value of Colistin in this new epidemiological situation is not reduced by the fact that it does not act as rapidly or as certainly as was the case with monocyclin especially against the classic enteropathogenic coli types. Order from SLA $1.60 TT-63-20903

DESCRIPTORS: *Muscles, Diseases, Muscular atrophy, *Metabolism disorders.

In 1956 Moersch and Woltman first described an illness which was characterized by an increasing, progressive and fluctuating muscle stiffness and hardening over a period of years to decades. On the basis of this stiffness the syndrome received its name. In about half of the cases severe to very severe painfull spasms occur. (Biological Sciences--Pathology. TT, v. 11, no 3)(over)

Order from STA $1.10 63-10042

Trans. of Deutsche Medizinische Wochenschrift (West Germany) 1962, v. 87, no. 3, p. 1613-1614.

DESCRIPTORS: *Stomach, Secretion, *Acids, Test methods, Urine, Medical procedures, *Colorimetry, Drugs, Caffeine, Pyridines.

A simplified form of the "Gastracid" test is described; no control urine sample is required. After a red colour of the acidified urine has developed, alkalinity is achieved by adding sodium hydroxide. If the red colour disappears, the test is positive and a control urine sample need not be tested. 50 control tests were performed to show that, if desired, a cup of Nescafe can take the place of the caffeine tablet. In patients confined to bed this is in fact preferable. (Author)
